Summary

DevOps and cloud-focused engineer specializing in Infrastructure as Code (IaC), Kubernetes orchestration, and CI/CD automation. Experienced in managing AWS resources including EC2, VPC, RDS and S3, with hands-on expertise in Linux administration, automated configuration, and system optimization. Skilled in Python (FastAPI, Boto3) for building async microservices, along with Prometheus and Grafana for cluster monitoring and performance tracking. Seeking entry-level opportunities in DevOps, Cloud Support, System Administration, or Python backend development.

Education

Bachelor Of Computer Application (BCA)

HEC Group Of Institutions, Haridwar, Uttarakhand

Graduated: 2024

Percentage: 75%

Technical Skills

Cloud & Infrastructure : AWS (EC2, S3, RDS, VPC, IAM, ECR), Linux Administration, Terraform, Ansible

Containers & Orchestration : Docker, Docker Compose, Kubernetes(Pods, Deployments, Services, RBAC, NetworkPolicies), Helm

CI/CD & GitOps : Jenkins(Pipeline-as-Code), GitOps(ArgoCD), YAML

Monitoring : Prometheus, Grafana — tracking HTTP rate, latency, pod CPU/memory

Programming & Backend: Python (Boto3, FastAPI), Bash scripting, RESTful APIs, PostgreSQL

Networking : DNS, OSI Model, TCP/IP, Load Balancing

Tools & Practices : Git, GitHub, Nginx, Postman, SDLC, Configuration Management

Projects

Automated Infrastructure & CI/CD Pipeline *Terraform, Ansible, K3s, Jenkins, FastAPI, AWS ECR* | [GitHub](#) **2026**

- Provisioned AWS infrastructure using modular Terraform, achieving full environment bootstrap in **under 3 minutes** with least-privilege IAM roles.
- Automated end-to-end configuration of Jenkins and K3s clusters using Ansible, eliminating manual SSH-based setup and configuration drift.
- Implemented secure CI/CD workflows enabling automated code-to-cluster deployment with security-gated ECR token regeneration.

GitOps CI/CD — Multi-Environment Deployment *Jenkins, ArgoCD, Kubernetes, Docker, FastAPI* | [GitHub](#) **2026**

- Architected a 3-stage GitOps pipeline (Dev → Staging → Prod) using ArgoCD for automated synchronization and Kubernetes health checks.
- Reduced Mean Time to Recovery (**MTTR < 2 minutes**) by implementing automated rollbacks via version tracking and Git tags.
- Eliminated infinite CI/CD loops by configuring authorship-based commit filtering, preventing ArgoCD syncs from re-triggering Jenkins builds.

SecureFlow - DevSecOps Platform *FastAPI, Jenkins, Terraform, Kubernetes, AWS, Prometheus* | [GitHub](#) **2026**

- Deployed 5 FastAPI microservices on K8s using Celery/Redis for **non-blocking async processing** and JWT for secure authentication.
- Integrated a security-gated pipeline (Bandit, Gitleaks, Trivy) to scan for secrets and vulnerabilities, achieving **zero critical vulnerabilities** in production.
- Managed full-stack AWS resources (VPC, RDS, ElastiCache) using Terraform, ensuring high availability and infrastructure-as-code consistency.
